

# Unpacking and Setup

Carry out the following one-time setup the first day the machine arrives. Allow about 15 minutes; you will need the supplied portafilter and one of the included filter baskets.

- Remove all packaging materials, including the protective films on the drip tray and the cup warming surface.
- Place the machine on a level, water-resistant surface within reach of a grounded power outlet.
- Rinse the water reservoir with cold tap water, then fill it to the MAX line with fresh, cold drinking water. Do not use distilled or softened water.
- Insert the reservoir, then attach the empty portafilter to the group head and tighten to the locked position.
- Plug the machine in and turn the main power switch to ON. The indicator light will blink while the boiler heats; it becomes steady when ready (about 60 seconds).
- Continue with First-Time Priming before brewing your first shot.
