

First-Time Priming

Priming pushes the first batch of water through the boiler, the brew circuit, and the steam circuit. Do this once before the first use, and again any time the reservoir runs dry.

- Confirm the reservoir is full and the machine is powered on and at temperature.
- Place an empty cup under the group head. Press the manual brew button and let the machine run water through the group head for about 20 seconds, or until water flows in a steady stream. Stop the brew.
- Place an empty pitcher under the steam wand. Open the steam knob and let water/steam flow for about 10 seconds, then close the knob.
- Discard the priming water. The machine is now ready for normal use.
